

JUnit Testing Exercises Output

Exercise 1: Setting Up JUnit

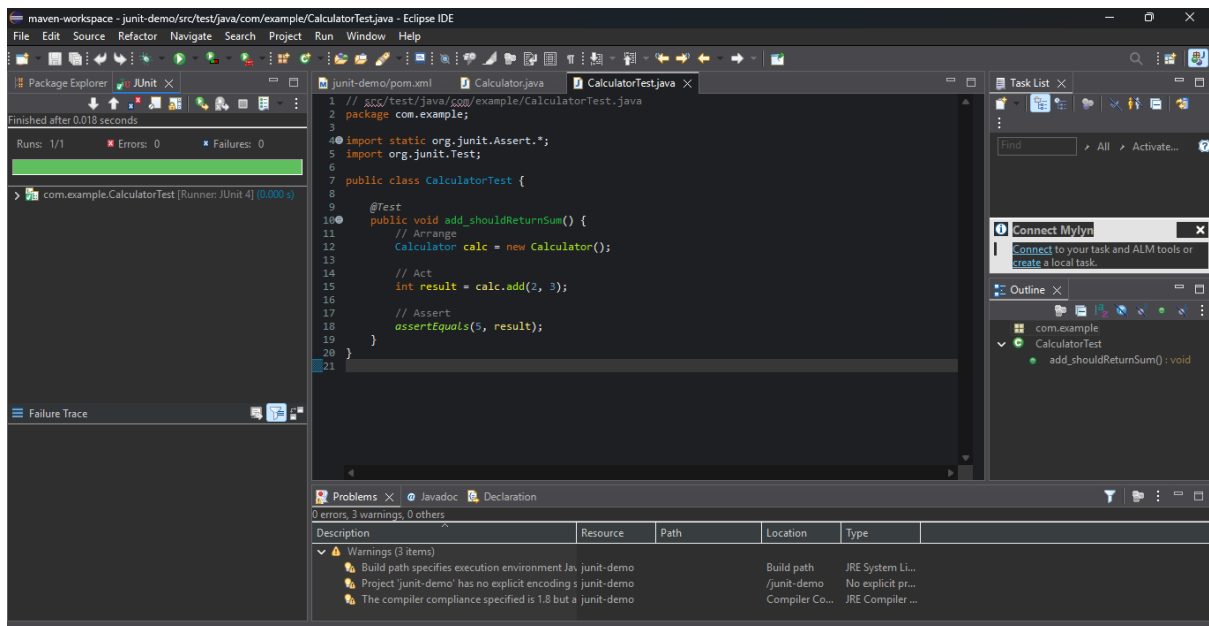

Output:

Set-up: Add JUnit as a *test-scope* dependency (or Gradle equivalent) and create a test class—JUnit is now wired in.

Exercise 2: Writing Basic JUnit Tests

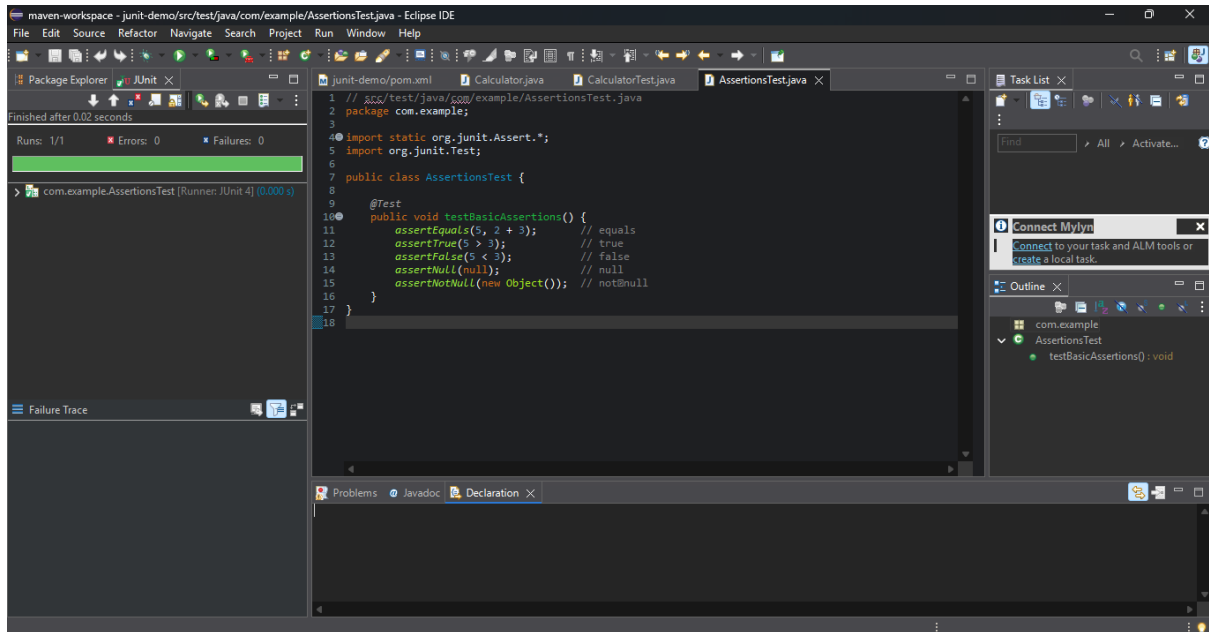

Output:

Basic tests: Write methods annotated with `@Test` to check the behaviour of your production code; run them via IDE or `mvn test`

Exercise 3: Assertions in Junit

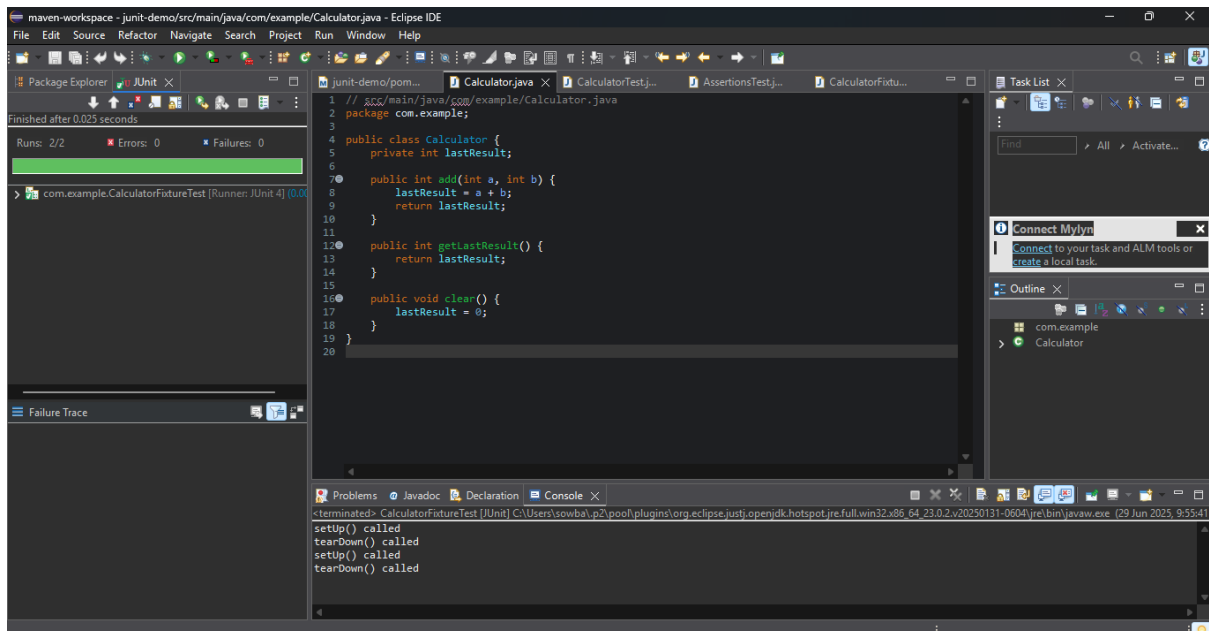

Output:

Assertions: Leverage the full assertion palette—`assertEquals`, `assertTrue/false`, `assertNull/NotNull`, etc.—to express expected outcomes clearly.

Exercise 4: Arrange-Act-Assert (AAA) Pattern, Test Fixtures, Setup and Teardown Methods in Junit

Output:

Structure & hygiene: Follow Arrange-Act-Assert to keep tests readable, and use `@Before/@After` (or JUnit 5's `@BeforeEach/@AfterEach`) to set up and tear down shared test fixtures, ensuring isolation and reliability.
